portal-shaped vertical frame and lifting robots for bringing the tip parts into contact with the left and right corners on the inside upper part of the container so as to lift each corner in an ascending direction, which have an adjustable length and are attached to the upper part of the vertical frame at positions slightly towards the inside of the vertical frame in the widthwise direction, is not disclosed or suggested in any of documents 1 to 6; furthermore, the feature in question would not have been obvious to a person skilled in the art.

The invention set forth in claim 7 is novel and involves an inventive step in relation to documents 1 to 3, which are cited in the international search report, and documents 4 to 6, which are newly cited. The feature wherein the vertical bracing member, which comes into contact with the inside of the upper part of the container so as to apply an upward force thereto, is mounted to the base member by means of pins and is configured so as to rise up from the base member in cases when said vertical bracing member has been attached to a diagonal brace that constitutes a brace strut, and so as to lie flat upon the base member along with the diagonal brace in cases when said vertical bracing member has been detached from said diagonal brace is not disclosed or suggested in any of documents 1 to 6; furthermore, the feature in question would not have been obvious to a person skilled in the art.

The invention set forth in claim 8 is novel and involves an inventive step in relation to documents 1 to 3, which are cited in the international search report, and documents 4 to 6, which are newly cited. The feature

wherein the vertical bracing member, which comes into contact with the inside of the upper part of the container so as to apply an upward force thereto, is configured so as to rise up from the base member in cases when said vertical bracing member has been mounted to the base member by means of a plurality of pins that do not have the same central axis, and so as to lie flat upon the base member in cases when said vertical bracing member has been unmounted by releasing the plurality pins that do not have the same central axis is not disclosed or suggested in any of documents 1 to 6; furthermore, the feature in question would not have been obvious to a person skilled in the art.

In addition, the inventions set forth in claims 2, 4 to 6, 9 to 11 and 13 to 18 all cite claim 1, claim 7 or claim 8, and thus the inventions in question are novel and involve an inventive step in relation to documents 1 to 3, which are cited in the international search report, and documents 4 to 6, which are newly cited, for the same reasons as are presented with regards to claim 1, claim 7 and claim 8.
